Shear-induced uncertainty

SIU in glucose-insulin dynamics

Future work

Motivation

Successful medical intervention requires reliable prediction.

- Uncertainty about exact patient state
- Uncertainty about the intervention itself
- Sensitivity of treatment to timing
- Repeatability of treatment outcomes
- If prediction reliability fails for a physiological system:

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

- Mechanisms?
- Mathematical characterization?
- Clinial impact?
- Mitigation?

Take-home messages

Prediction reliability can fail for the glucose-insulin system.

- Induced by delay
- Precisely characterized by shear-induced uncertainty (SIU) theory

SIU is subtle:

- May or may not occur in a given physiological setting
- Difficult to detect
- Renders mysterious the reasons for treatment failure (interpretability)

SIU recipe

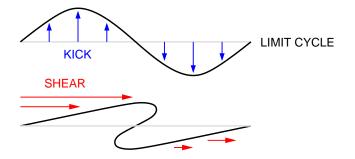

Ingredients:

- 1. Weakly stable invariant dynamical structure (e.g. limit cycle)
- 2. Shear
- 3. External forcing
- 4. Interaction between external forcing and shear

Results:

- 1. Temporally-persistent dynamical instability (positive Lyapunov exponent)
- 2. Complex attractors
- 3. Genuine nonuniformly hyperbolic dynamics
- 4. Strong statistical properties (e.g. large deviations principle, exponential decay of correlations)

Linear shear flow - geometry

Phase space: $(heta,z)\in\mathbb{S}^1 imes\mathbb{R}$ Intrinsic system

$$\begin{cases} \frac{d\theta}{dt} = 1 + \sigma z \\ \frac{dz}{dt} = -\lambda z \end{cases}$$

Forced system

$$\begin{cases} \frac{d\theta}{dt} = 1 + \sigma z \\ \frac{dz}{dt} = -\lambda z + \alpha \Phi(\theta) \sum_{n=0}^{\infty} \delta(t - nT) \end{cases}$$

 σ : shear λ : contraction α : kick amplitude T: relaxation time Key diagnostic $\frac{\sigma \alpha}{\lambda} = \frac{(\text{shear})(\text{kick amplitude})}{(\text{contraction})}$

$$\begin{cases} \frac{d\theta}{dt} = 1 + \sigma z \\ \frac{dz}{dt} = -\lambda z + \alpha \Phi(\theta) \sum_{n=0}^{\infty} \delta(t - nT) \end{cases}$$

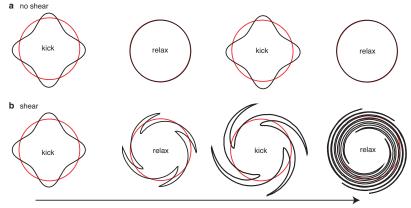

Properties of the time-T map H_T

- 1. $\frac{\sigma \alpha}{\lambda}$ small: invariant curve (diffeomorphic to \mathbb{S}^1) attracts every trajectory
- 2. $\frac{\sigma \alpha}{\lambda}$ large: SIU for a set of *T*-values of positive Lebesgue measure (Wang/Young 2003)

Analyze the ' $T \rightarrow \infty$ ' singular limit:

$$g_{a}(\theta) := \lim_{k \to \infty} H_{k+a}(\alpha \Phi(\theta))$$
$$g_{a}(\theta) = \theta + a + \frac{\sigma \alpha}{\lambda} \Phi(\theta)$$

Kick-relax cycle

time

Ultradian model

$$\begin{cases} \frac{dI_p}{dt} = f_1(G) - E\left(\frac{I_p}{V_p} - \frac{I_i}{V_i}\right) - \frac{I_p}{t_p} \\ \frac{dI_i}{dt} = E\left(\frac{I_p}{V_p} - \frac{I_i}{V_i}\right) - \frac{I_i}{t_i} \\ \frac{dG}{dt} = f_4(h_3) + I_G(t) - f_2(G) - f_3(I_i)G \\ \begin{cases} \frac{dh_1}{dt} = \frac{1}{t_d}(I_p - h_1) \\ \frac{dh_2}{dt} = \frac{1}{t_d}(h_1 - h_2) \\ \frac{dh_3}{dt} = \frac{1}{t_d}(h_2 - h_3) \end{cases}$$

 $I_G(t)$: Nutritional drive t_d : Delay timescale

(日)、(型)、(E)、(E)、(E)、(O)へ(C)

Nutritional drive

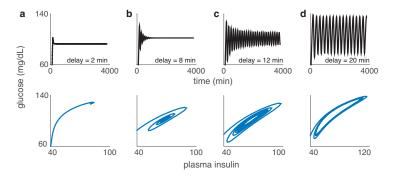

$$I_G(t) = I_0 + \sum_{n \in \mathbb{N}} A_n \delta(t - T_n)$$

- ► *I*₀: Basal nutritional input
- \triangleright A_n : Carbohydrate content of meal n
- \blacktriangleright T_n : Time of meal n

Delay-induced supercritical Hopf bifurcation (No kicks!)

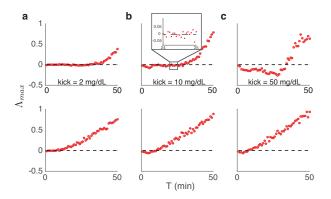

Increasing t_d produces oscillations

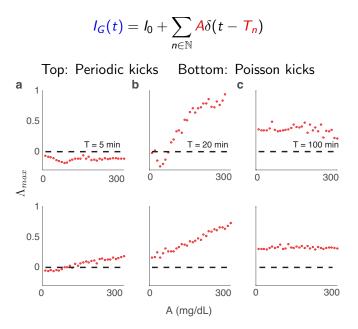

Top Lyapunov exponent indicates SIU emergence

$$I_G(t) = I_0 + \sum_{n \in \mathbb{N}} A\delta(t - T_n)$$

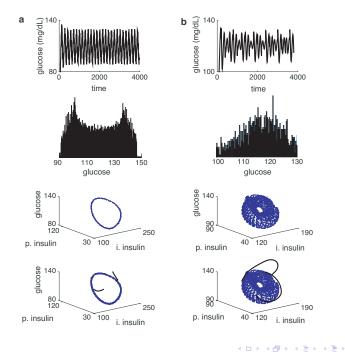

Top: Periodic kicks ($T_n = nT$) Bottom: Poisson kicks ($T_{n+1} - T_n$ IID exponential with mean T)
